Murine adrenergic

by the

encodes

encodes the rat serotonin St-B173 receptor and was clone St-B173. The putative intron, found in clo

clone

When compared to previously cloned G-protein coupled receptors, the transmembrane regions of St-HI7 exhibited high homology to various serotonin (5-HI) receptors suggesting that it may be a member of this receptor family. Within the transmembrane regions, St-BI73, exhibits homology of 41%, 39%, 38%, 37% and 36% with 5-HI2, 5-HI1D, 5-HI1C, 5-HI1B, 5-HI1B and 5-HI1E receptors respectively. The isolated gene, St-BI7, encodes a protein which may be used to test CNS activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   St-B172, was absent from this clone with the flanking exons being spliced together at nucleotide 873. Splicing at this position results in a 1311 bp open reading frame encoding a protein of 437 amino acids with a molecular weight of 46.8 kb. Hydropathy analysis of this amino acid sequence indicated several hydrophobic regions predicted to
              cardiomyopathy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 that comprises 1-70 or more mutations, excluding the sequence with the comprises 1-70 or more mutations, excluding the sequence with the comparison shala45Gly or Gly1165Cys. The invention also describes (1) can method for determining predisposition to disease by genotyping DNA of CC (1) at one or more exchanged position and comparison with a reference conclude at least one of the amino acid changes Ser49Gly, Ala59Ser, CC include at least one of the amino acid changes Ser49Gly, Ala59Ser, CC Gly389Arg, Arg399Cys, His402Arg, Thr404Ala and/or Pro418Ala, but CC excluding the sequence with a single amino acid exchange at positions 49 CC or 389. Genotyping of (1) is used to determine predisposition to CC cardiomyopathy, specifically the dilative form, also for prognosis and CC assessing severity of this condition. Gene (1) can be used for the CC of beta1-adrenoreceptor (ant)agonists; (ii) construction of genes or CC vectors, especially for pharmaceutical development; specifically a new class conditional responses to different beta1 adrenoreceptor, (ant)agonists, (iii) construction and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
This sequence represent the canine beta 3-adrenergic receptor (RA-Ca-b3). The coding sequence was isolated from a cDNA library constructed from polyA+ RNA purified from dog brown adipose tissue cells. The probe was a fragment of the coding region of the human beta-3 adrenergic receptor covering the region from the initiation codon to transmembrane domain 7 (TM7) amplified by primers AAV30511-V30512. The full length insert was cloned into M13 for sequencing using primers AAV30470-V30490. The sequence can then be expressed e.g. in a mammalian cell, by subcloning into an expression vector such as pCDNA3. RA-Ca-b3 has been implicated in obesity and obesity-related metabolic disorders
                                                                                                                               Canine beta 2 and beta 3 adrenergic receptors and coding useful for identifying specific ligands and (ant)agonists specific treatments for obesity in dogs
                                                                                                                                                                        WPI; 1998-032136/03.

The canine version of RA-Ca-b3 can be used to develop treatments specific for dogs. The sequence can also be used in differential screening for ligands for RA-Ca-b3 as compared to the betadrenergic receptor (AAW44932).
Fat cell specific beta- adrenergic receptor polypeptide - used for diagnosis of obesity due to inactive lipolysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             09-JUN-1993

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             probes with DNA probes encoding human beta-1 and rat beta-2 adrenergic receptors under low stringency conditions. Positive clones were found to be different from the rat and human sequences and contained a single open reading frame of 1200 bp encoding the protein shown, of 400 amino acids and mol. wt. 43 kD. The protein is the fat specific beta-adrenergic receptor and may be used in work on the thermogenesis process. Isolation of the gene for BAR allows the diagnosis and treatment of obesity and the testing of medications for their effectiveness in stimulating the thermogenesis metabolic

The peptide contains 7 transmembrane regions, all of which are claimed individually and are useful for the generation of probes for screening compounds that have agonist/antagonist activity to the receptor. (See AAR70668-74). These probes are specific to the beta3 gene and not to beta1 or beta2 genes. These cpds. could be used to regulate the level of fat in animals, partic. for improved meat quality.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid encoding the bovine beta3 adrenergic receptor - are related peptide(s), vectors and transformed cells, useful for identifying specific agonists and antagonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 16; Page 3.-5; 52pp;

Host cells transformed with a vector comprising the amine receptor coding sequence are used for the recombinant production of the polypeptide. The polypeptides are useful for treating conditions related to underexpression and over-expression of the human amine receptor. The present

The cells then express the receptor on their surfaces and can be used to study the effects of various chemical agents on the receptor which is coupled to adenylate cyclase and hormone sensitive lipases.
                                                                                                                                                                                                                                                                                                                        Isolated receptor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The D1 dopamine receptor sequence was obtained from two overlapping clones, one genomic (HGLZ6) and the other from a human retina cDNA library (D233). The amino acid sequence was deduced from the nucleotide coding sequence. The receptor is similar to known G-protein coupled proteins, e.g. Cys(351) in the carboxyl terminus near transmembrane VII is conserved in most G-protein-coupled receptors; it may be palmitoylated. The carboxyl tail also contains several putative sites for phosphorylation by an agonist-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cloned gene encoding screening, diagnosis or in gene therapy

The library was probed by a known 450bp rat D1 clone. Three positive clones with inserts of ca. 14kb were isolated. One of the clones was restriction analysed and sequenced to reveal an open reading frame of 1476 bp encoding a 446 amino acid protein the D1 receptor belongs to the G-protein family; it regulates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Dopamine D1 receptor; adenylate cyclase stimulation; cAMP-dependent protein kinase activation; psychomotor disorders;

                                              The murine beta-3 adrenergic receptor gene encodes a polypeptide with 82% homology with the human beta-3 adrenergic receptor. The homology is concentrated in the 7 transmembrane domains. See also AAQ26804-7.

The receptor also couples with guanine nucleotide binding regulatory (G) proteins. By constructing cell lines that express the D1 receptor, the affinities and efficacies o agonist and antagonist drugs can be assessed.

The amino acid sequence was deduced from the nucleotide coding sequence. The receptor is similar to the human D1 dopamine receptor (see ARR15498) and known 6-protein coupled proteins e.g. Cys(351) in the carboxyl terminus is conserved in most 6-protein coupled receptors; it may be palmitoylated. The carboxyl tail also contains several putative sites for phosphorylation by an agonist-

Guthrie C.R., Heldmann D.E.A., Hamblin M.W.;

Mutagenesis studies of the mouse 5-HT6 serotonin receptor.";

Submitted (MAR-1999) to the EMBL/GenBank/DDBJ databases.

-i- FUNCTION: THIS IS ONE OF THE SEVERAL DIFFERENT RECEPTORS FOR 5-HYDROXYTEXPTAMINE (SEROTONIN), A BIOGENIC HORMONE THAT FUNCTION.

A NEUROTRANSMITTER, A HORMONE, AND A MITGGEN. THE ACTIVITY OF THE RECEPTOR IS MEDIATED BY G PROTEINS THAT STIMULATES ADENVLATE CYCLASE. IT HAS A HIGH AFFINITY FOR TRICYCLIC PSYCHOTROPIC DRUGS

(BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               between the Swiss Institute of Bioinformatics and the EMBL the European Bioinformatics Institute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            241
                                                                                                                                                                                               CYCLASE. IT HAS A HIGH AFFINITY FOR TRICYCLIC PSYCHOTROPIC DRUG SUBCELULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
TISSUE SPECIFICITY: LOCALIZED EXCLUSIVELY IN THE CENTRAL NERVOL SYSTEM, PREDOMINARTLY IN THE CORPUS STRIATUM BUT ALSO IN VARIOU LIMBIC AND CORTICAL REGIONS.
SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                            FUNCTION: THIS IS ONE OF THE SEVERAL DIFFERENT RECEPTORS FOR 5-HYDROXYTRYPTAMINE (SEROTONIN), A BIOGENIC HORMONE THAT FUNCTION AS A NEUROTEANSMITTER, A HORMONE, AND A MITGGEN. THE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS THAT STIMULATES ADENYLATE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ω

Jasper J.R., Link R.E., Chruscinski A.J., Kobilka B.K., Bernstein D
"Primary structure of the mouse beta 1-adrenergic receptor gene.";

Biochim. Biophys. Acta 1178:307-309(1993).

-i- FUNCTION: BETA-ADRENERGIC RECEPTORS MEDIATE THE CATECHOLAMINE-
INDUCED ACTIVATION OF ADENULATE CYCLASE THROUGH THE ACTION OF G
PROTEINS. THIS RECEPTOR BINDS EPIMEPHRINE AND NOREPINEPHRINE WI
APPROXIMATIVELY EQUAL AFFIRITY.

-i- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-i- PTM: HOMOLOGOUS DESENSITIZATION OF THE RECEPTOR IS MEDIATED BY
PHOSPHORYLATION BY BETA-ADRENERGIC RECEPTOR KINASE.

-I- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                             G-protein

novel polymorphism in the gene coding for the beta(1)-adrenergic eptor associated with survival in patients with heart failure.";

Heart J. 21:1853-1858(2000).

FUNCTION. BETA-ADRENERGIC RECEPTORS MEDIATE THE CATECHOLAMINE-INDUCED ACTIVATION OF ADENYLATE CYCLASE THROUGH THE ACTION OF G PROTEINS. THIS RECEPTOR BINDS EPINEPHRINE AND NOREPINEPHRINE WITH APPROXIMATIVELY EQUAL AFFINITY.

SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

PTM: HOMOLOGOUS DESENSITIZATION OF THE RECEPTOR IS MEDIATED BY ITS PHOSPHORYLATION BY BETA-ADRENERGIC RECEPTOR KINASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           R---
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      LEPWAGYNGGAAANSDSSPDEPSRAGCA 462
